

## ABSTRACT

A rail assembly (10) for attaching a server tray (60) into a cabinet includes a pair of rail brackets (80) mounted in sidewalls of the cabinet, a pair of outer rails (30) movably received in the rail brackets, and a pair of inner rails (20) attached to opposite sides of the server and movably received in the outer rails. Each rail bracket includes a first part (40), and a second part (50) adjustably connected with the first part. Each outer rail has a blocking member (322, 322') formed therein. Each inner rail has an acting member (242, 242') formed therein engaging with the blocking member of the outer rail. Therefore the outer rails can be moved outward together with the inner rails for fully drawing the server out of the cabinet with the outer rail detaching from the rail bracket, when the server needs to be maintained.
